

1. Recursion

Example 1: Max Couple at Inverted Indexes

Recursion1

```
1 def max_couple(list, length):
2     return max_couple_helper(list, length)
3
4 def max_couple_helper(list, length, max = 0, start = 0):
5     if length == 0 or (length == 1 and list[length + start - 1] <= max):
6         return max
7
8     if length == 1 and list[length + start - 1] > max:
9         return list[length + start - 1]
10
11    if list[start] + list[length + start - 1] > max:
12        max = list[start] + list[length + start - 1]
13
14    return max_couple_helper(list, length - 2, max, start + 1)
```

Example 2: Twin Neighbors

Recursion2

```
1 def twin_neighbours(my_list):
2     return twin_helper(my_list, len(my_list) - 1)
3
4 # Helper for q1
5 def twin_helper(my_list, last_index, count=0):
6     if last_index == 0:
7         return 0
8     if my_list[last_index] == my_list[last_index - 1]:
9         return 1 + twin_helper(my_list, last_index - 1)
10    else:
11        return twin_helper(my_list, last_index - 1)
```

Example 3: יעני פיבונצ'י

Recursion3

```
1 def like_fibo(nth):
2     if nth <= 3:
3         return nth
4
5     elif nth % 2 == 0:
6         return like_fibo(nth - 1) + like_fibo(nth - 2) + like_fibo(nth - 3)
7     else:
8         return abs(like_fibo(nth - 1) - like_fibo(nth - 3))
```

Example 4: מספר מתחלף

Recursion4

```
1 def is_switched_number(number):
2     if number < 10:
3         return True
4     dig0 = number % 10
5     dig1 = number // 10 % 10
6     if (dig0 % 2 == 0 and dig1 % 2 == 0) or (dig0 % 2 != 0 and dig1 % 2 != 0):
7         return False
8
9     return is_switched_number(number // 10)
10 '''
```

2. String

Example 1: Check Email Address Validity

String1

```
1 def is_valid_email(address):
2     username = address.split('@')[0]
3     domain_name = address.split('@')[-1]
4     country_code = domain_name.split('.')
5
6     check1_at_symbol = address.count('@') == 1
7     check2_length = len(address) >= 8 and len(address) <= 30
8     check3_first_letter = (address[0]).isalpha()
9     check4_lower_complexity = False
10    check4_upper_complexity = False
11    check5_server_validity = '.' in domain_name and len(country_code[-1]) >= 2
12    check6_country_code_validity = True
13
14    for letter in username:
15        if letter.islower():
16            check4_lower_complexity = True
17        elif letter.isupper():
18            check4_upper_complexity = True
19    for letter in country_code[-1][-2:]:
20        if not letter.isalpha():
21            check6_country_code_validity = False
22
23    is_valid = (check1_at_symbol and check2_length and check3_first_letter and check4_lower_complexity \
24                and check4_upper_complexity and check5_server_validity and check6_country_code_validity)
25    return is_valid
```

Example 2: Capitalize Words

String2

```
1 def capitalize_words(input_string):
2     str_as_list = input_string.split(' ')
3     str_as_list = [word for word in str_as_list if word != '']
4     str_as_list = [word.capitalize() for word in str_as_list if word != '']
5     # str_as_list = [word.capitalize() for word in input_string.split(' ') if word != '']
6
7     res_str = ' '.join(str_as_list)
8     return res_str
```

3. Lists

Example 1: Rotate Matrix

כתבו הפונקציה המקבלת מטריצה ומסובבת אותה ב- 90 מעלות עם כיוון השעון (ימינה). אין להשתמש ברשימות עזר. יש לבצע הכל על המטריצה המקורית ולא slicing.

Lists1

```
1 def rotate_matrix_90_degrees_clockwise_v1(matrix):
2     for i in range(len(matrix) // 2):
3         for j in range(len(matrix) // 2):
4             top_left = matrix[i][j]
5             top_right = matrix[j][-i - 1]
6             bottom_right = matrix[-i - 1][-j - 1]
7             bottom_left = matrix[-j - 1][i]
8
9             temp = top_left
10
11            matrix[i][j] = bottom_left
12            matrix[-j - 1][i] = bottom_right
13            matrix[-i - 1][-j - 1] = top_right
14            matrix[j][-i - 1] = temp
15
16    return view_as_matrix(matrix)
```

Example 2: Snake

Lists2

```
1 def create_snake(rows, cols):
2     arr = [[None] * cols for i in range(rows)]
3     value = 1
4     col_index = -1
5
6     for times in range(len(arr)):
7         for row in range(len(arr)):
8             if col_index % 2 != 0:
9                 arr[row * -1 - 1][col_index] = value
10            else:
11                arr[row][col_index] = value
12                value += 1
13                col_index -= 1
14            if abs(col_index) > cols:
15                break
16
17     return arr
```

Example 3: Diagram Graph

Lists3

```
1 def diagram_graph(list):
2     max_val = max(list)
3
4     for row in range(max_val, 0, -1):
5         for i in range(len(list)):
6             if list[i] >= row:
7                 print('*', end = ' ')
8             else:
9                 print(' ', end = ' ')
10            print()
11
12     #Cosmetic:
13     # Add cosmetic lines here
```

Example 4: חיבור ארוך

Lists4

```
1 def sum_lists(list1, list2):
2     longer_l, shorter_l = (list1, list2) if len(list1) >= len(list2) else (list2, list1)
3     summed_list = [None] * (len(longer_l) + 1)
4     leftover = 0
5
6     for i in range(len(longer_l)):
7         item = longer_l[-i - 1] + leftover
8         if i < (len(shorter_l)):
9             item += shorter_l[-i - 1]
10        if item > 9:
11            item -= 10
12            leftover = 1
13        else:
14            leftover = 0
15            summed_list[-i - 1] = item
16
17    if leftover == 1:
18        summed_list[0] = 1
19    else:
20        summed_list.remove(None)
21
22    return summed_list
```

4. Dictionary

Dictionary

```
1 def get_books_name_for_reader(books, readers, reader_name): # Exercise 2's Function
2     leased_books = []
3     for reader in readers:
4         if reader['name'] == reader_name: # Found the dictionary of our reader
